Changing pitch without changing tempo in an evp

Posted by jr244888 - 18 Jul 2012 05:20

Has anyone ever tried changing the pitch without changing the tempo on an evp? I

recorded a series of evps that I could easily amplify, change speed, or remove noise on to figure out what they were saying. But one particular one, no matter how amplified, slowed down, sped up, or filtered, I still couldn't figure out what it said, it was too muffled, but to me it sounded like a female voice. So I tried something different and I changed the pitch on the evp by around 140 percent and clear as day could hear a female's voice with an intelligent answer. We said to talk into the red light and the voice says, "How are you?"the difference in clarity in simply remarkable and I was wondering if this process is recommended or not in evp evaluation. Thanks alot!

For whatever reason I'm not hearing anything on these EVPs. It could be me, it's late lol. I like the idea of switching the pitch though. I think when it comes to paranormal research, it's not a hard science, and thinking outside the box is really important.
