Probaby either dust or a insect passing through one of the beams from the laser grid being used. They are great for looking for shadows, but create their own set of artifacts.

---

if it was anything there I believe all the dots would have moved as well on the laser grid...I agree with Wes; could have been dust or an insect passing through....

Actually, did you look at the picture frame. Is it me or does it look like its moving slightly. Very interesting. I like this video!

I'm guessing its a bug? Just because of the flight path it is going is straight. But that is just my guess.

Good video none the less!

_____

It's definitely dust. We see the same effect on our static DVR cams all the time. That flickering light effect is from the dust particle reflecting the IR light from each of the individual IR bulbs. For us, it's a definite teller.

_____

I'm sorry, but I never liked orbs; although this is still interesting, but because it's moving so slow I'm going to say it was dust.
